

Sample IVA-2 Clinical Report

Name: Case, Sample

Age: 10 Sex: M Report Date: 1/20/2015 Test Date: 4/23/2014 10:43 AM On Meds: N

The use of this Clinical Report requires that tests be administered in accordance with the specified test guidelines under the supervision of a licensed health care professional who is qualified in the use and interpretation of psychological tests. The test by itself is not to be used as a stand-alone instrument in making any diagnosis. Its primary purpose is to provide examiners with one or more diagnoses to consider as part of their comprehensive evaluation of clients who present with ADHD-type symptoms. This clinical report will only be generated after clinicians answer all of the relevant questions and then determine, using their professional judgment, the client's clinical diagnosis. This report is only to be distributed to others after it has been carefully reviewed, modified as needed, and signed by the examiner.

He is a 10 year old male who presents with the primary symptoms of behavioral problems at home, behavioral problems at school, difficulty following instructions, difficulty staying organized, and difficulty sustaining attention. Symptoms were noted as occurring in the school and home settings. I have determined that these symptoms clearly impair his functioning. In addition, this individual has been identified as having difficulty sleeping. Significant inattentive and hyperactive/impulsive symptoms were observed during the IVA-2 test administration, but no significant ADHD-type symptoms were observed during the clinical intake. This individual's ADHD symptoms are not due to an inability to understand instructions. They are also not due solely to hostile or oppositional behavior.

This individual has not previously been diagnosed as having ADHD. His symptoms have persisted for a sufficient period of time to support a diagnosis of ADHD. One or more family members have been reported as being formally diagnosed with ADHD. This individual was not taking any medication at the time of testing that was likely to affect his test results.

The IVA-2 test results were fully valid, and this individual demonstrated sufficient motivation in completing this test. The test results suggested that the examiner consider the possible diagnosis of ADHD Combined presentation. The rating scales results identified symptoms that supported the examiner's consideration of the diagnosis of ADHD, Combined presentation.

Based on my clinical judgment and overall evaluation, this individual's diagnosis is ADHD, Combined presentation, Severe. In order to help him at this time, based on his diagnosis, I am making the following treatment recommendations: family counseling and individual psychotherapy. I am recommending that the following reasonable accommodations be made to help this individual in the school setting: arrange quiet test conditions and provide extra time on tests.

I have reviewed this interpretive report and have modified it as necessary in accordance with my comprehensive evaluation, the client's history and other relevant clinical data.
